

İlk görevlerde sistemdeki tüm container ve bridge network'ler temizlenerek çakışmalar önlenmiş, ardından "alistirma-agi" adında özel bir bridge network oluşturulmuş ve bu ağa web1 container'ı bağlanarak log mekanizması test edilmiştir. Geçersiz URL çağrılarıyla 404 hataları oluşturulup canlı log takibi yapılmış, ayrıca test1 container'ı farklı ağlar arasında taşınarak web1'e ping atılabilmiş ve ağlar arası erişim başarıyla doğrulanmıştır.

İkinci görevlerde denemeagi ağı üzerinde kaynak kısıtlamaları uygulanarak webkayit ve webdb servisleri başlatılmış, ortam değişkenleri ile servis iletişimi sağlanmış ve web arayüzünden veritabanı kaydı test edilerek tüm işlemlerin başarıyla tamamlandığı teyit edilmiştir. Daha sonra Docker Hub entegrasyonu yapılmış, docker login ile oturum açılarak public bir repository oluşturulmuş, çeşitli base imajlar pull edilmiş ve Ubuntu imajına yeni tag eklenerek başarılı bir şekilde Docker Hub'a push işlemi gerçekleştirilmiştir.

Üçüncü görevlerde özel konfigürasyonlara sahip imajlar oluşturmak amacıyla Dockerfile hazırlanmış, nginx:latest base imajı üzerine LABEL, ENV ve ARG talimatları eklenerek imaj kişiselleştirilmiş, sistem güncellenmiş ve gerekli paketler kurulmuştur. HEALTHCHECK talimatı ile imaj sağlık kontrolü eklenmiş ve farklı argümanlarla iki farklı imaj derlenerek test edilmiştir. Ayrıca Multi-Stage Build işlemi ile Java uygulaması derlenip çalıştırılmış ve imaj boyutu optimize edilmiştir. Son olarak yerel bir Docker Registry ayağa kaldırılarak üretilen imajlar bu yerel sunucuya gönderilmiş ve web arayüzünden kontrol edilmiştir.
